Crossing the River

Three adults and two children need to cross a river. They have a small boat. The boat can carry either one adult, **or** one or two children. How many one-way trips will it take for all children and adults to cross the river?

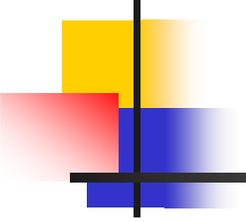

Guiding Principles for Shaping Pedagogy

1. **Challenging Mathematical Tasks**
2. **Multimodal Representation**
3. **Academic Language Application**

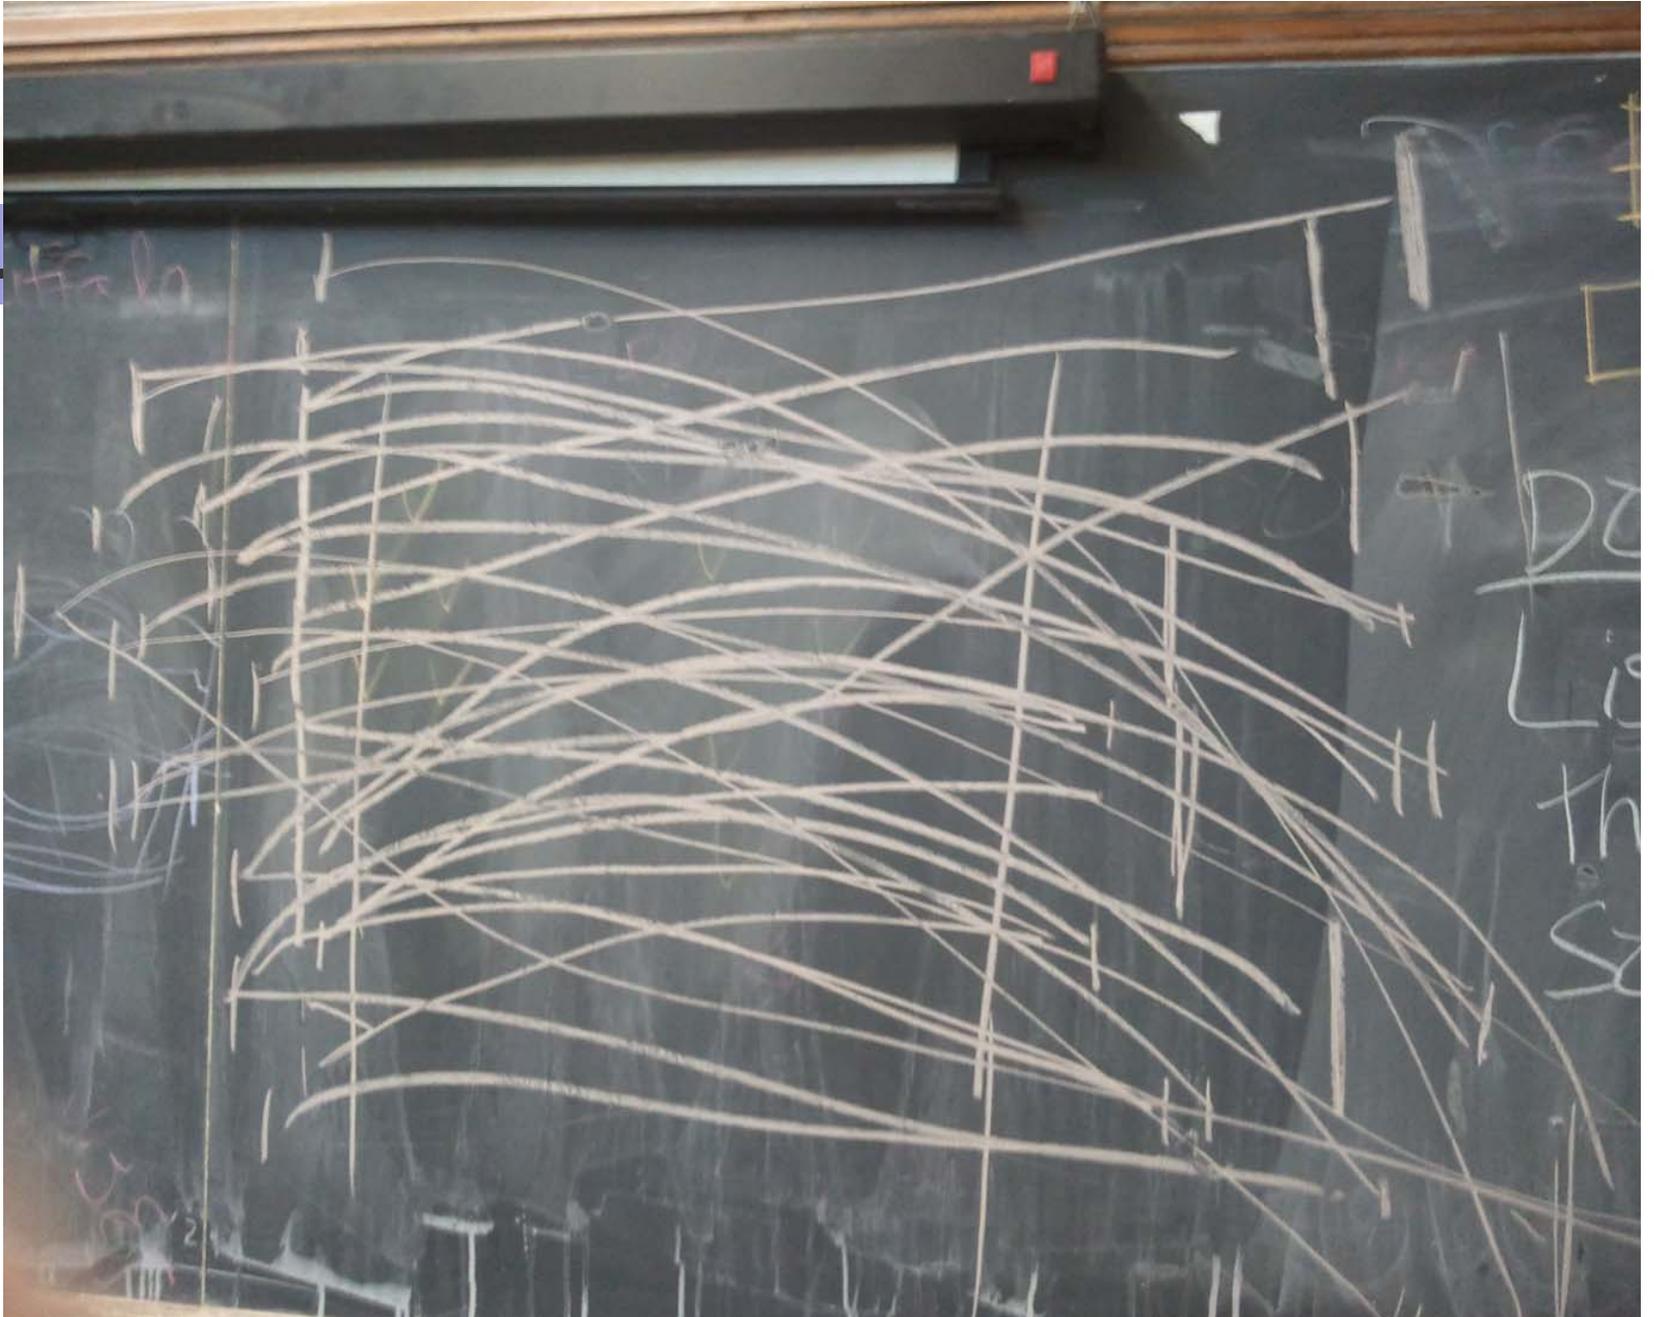

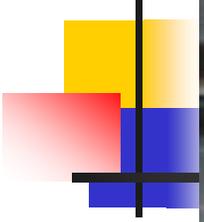

Challenging Mathematical Tasks Principle

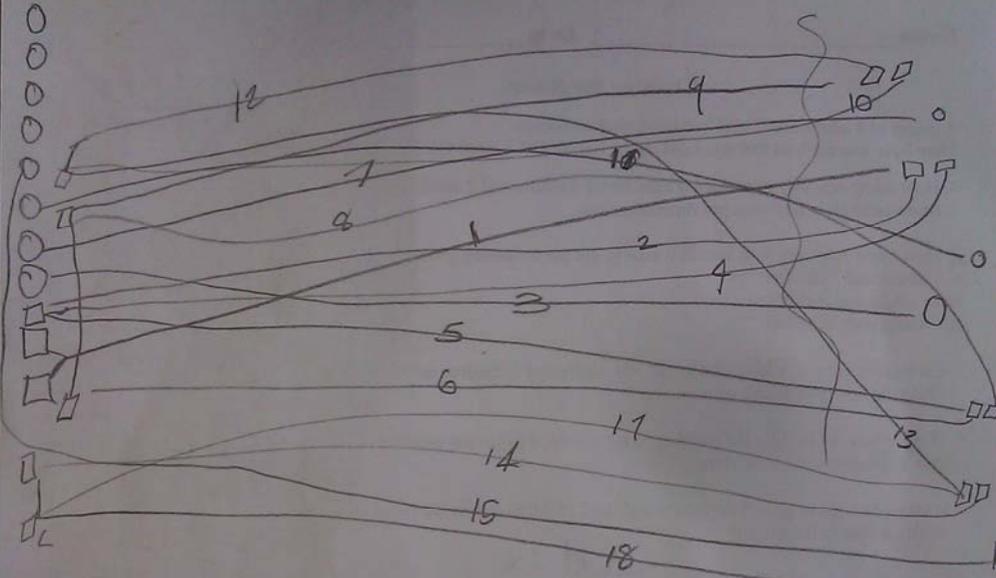

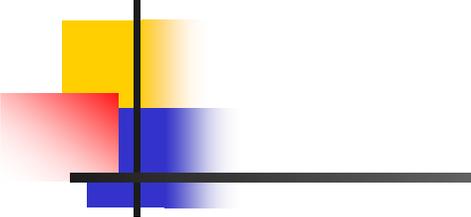

- **Engagement, accessibility, and success**
- Introducing the mathematical ideas and challenges in the lesson **without lowering the demand**
- Questioning students to **extend their thinking** and **promote sense-making**

Multimodal Representation Principle

- Giving opportunities for students to **use mathematical diagrams, drawings, gestures, physical models, symbols, or technology**
- Helping students learn **how to diagram mathematically in a way that makes sense**

1st 2 kids Leave.
 2nd 1 kid come Back.
 3rd Adult Leave
 4th kid come on
 5th 2 kids get on
 6th kid come Back
 7th Adult get on 2
 8th kid get on
 O = Adult
 □ = child
 24 1 kid get on
 25 2 kid get on
 26 1 kid get on
 27 Adult get on 7

9th 2 kid get on 28 1 kid get on
 10th kid get on 29 2 kid 2 kids
 11th Adult get on 30 1 kid 2 Adults
 12th kid get on 31 1 Adult =
 13th 2 kids get on 32 1 kid q+rms
 14th kid get on 33 2 kid
 15th Adult get on 4
 16th kid get on
 17th 2 kid get on
 18th kid get on
 19th ~~kid~~ get on Adult 5
 20th ~~kid~~ get on
 21st 1 kid get on
 22 2 kid get on
 23 1 kid get on
 23 Adult get on 6

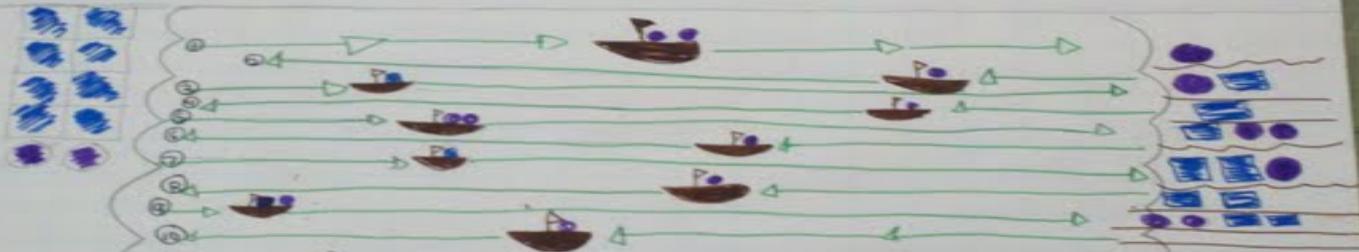

$q + q = 36$
 but you take away 3 trips =
 2K, 1K, 1A

Crossing The River

*
 Key
 2 Kids
 1 Kid
 1 Adult
 1 Kid

How many one-way trips does it take for 1 adult and two kids to cross the river?

31 One-way trips.

Keep up to 31 lines.
 Pattern:

Two Kids

One Kid

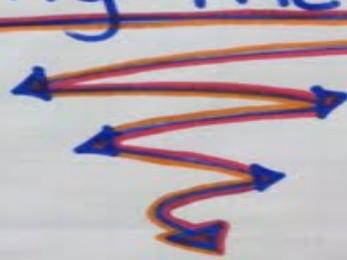

One Adult

One Kid

Key:

● = Adults
 ● = Kids

Crossing the River

Counting by how much the 8 Adults and the 2 children cross the river

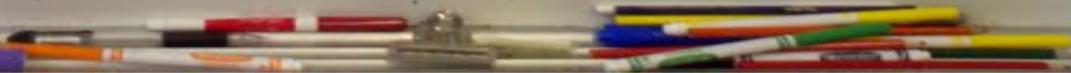

Pattern

The way that the 8 adults and the 2 children could cross the river is by a pattern that is 2 children cross the river. And then 1 children stay in the other side of the river. And then the other one cross the river again. And then the children stay and then a adult cross the river. And then the children that was in the other side needs to cross the river. And then he need to go back to get the other children. And then the pattern repeats self.

Academic Language Principle

- Students **connect mathematical language to mathematical symbols**
- **Prompting** students to use mathematically accurate language
- **providing** students ample **opportunity** to read, write and speak about mathematics
- **Rephrasing students everyday language** with proper mathematical language

Recommendations

- **Teacher collaboration** for planning and inter-visitations
- **Ample Time** to negotiate meaning of tasks and solutions
- **Questioning Techniques** to advance student thinking
- **Rephrasing students everyday language** with proper mathematical language
